

## 3 Watt Mono Filter-Free Class-D Audio Power Amplifier

### Features

- Efficiency With an 8-Ω Speaker:
  - 88% at 400 mW
  - 80% at 100 mW
- 2.6mA Quiescent Current
- 0.4μA Shutdown Current
- Optimized PWM Output Stage Eliminates LC Output Filter
- Internally Generated 250-kHz Switching Frequency Eliminates Capacitor and Resistor
- Improved PSRR (−75 dB) and Wide Supply Voltage (2.8 V to 5.5 V) Eliminates Need for a Voltage Regulator
- Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
- Improved CMRR Eliminates Two Input Coupling Capacitors
- Available in space-saving package: 9-bump WLCSP

### General Description

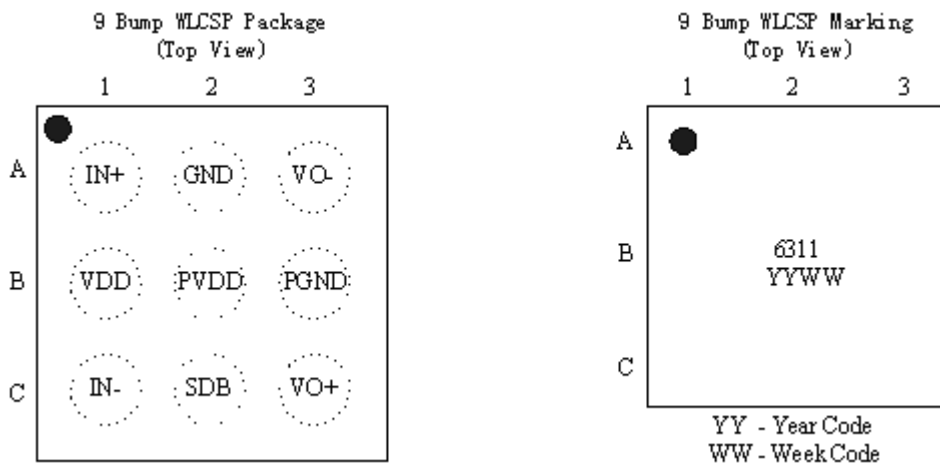

The BL6311B is a 3-W high efficiency filter-free class-D audio power amplifier in a wafer chip scale package (WCSP) that requires only three external components.

Features like 88% efficiency, −75dB PSRR, and improved RF-rectification immunity make the BL6311B ideal for cellular handsets. In cellular handsets, the earpiece, speaker phone, and melody ringer can each be driven by the BL6311B.

### Applications

- Mobile phone、PDA
- MP3/4、PMP
- Portable electronic devices

### Pin Diagrams

**Pin Description**

| Pin # | Name | Description                    |
|-------|------|--------------------------------|
| A1    | IN+  | Positive differential input    |
| A2    | GND  | Power Ground                   |
| A3    | VO-  | Negative BTL output            |
| B1    | VDD  | Power Supply                   |
| B2    | PVDD | Power Supply                   |
| B3    | PGND | Power Ground                   |
| C1    | IN-  | Negative differential input    |
| C2    | SDB  | Shutdown terminal (low active) |
| C3    | VO+  | Positive BTL output            |

**Function Block Diagram**

Notes: Total Voltage Gain =  $Av1 \times Av2 = 2 \times \frac{150k}{R_i}$

**Absolute Maximum Ratings**

|                      |                   |
|----------------------|-------------------|
| Supply voltage       | -0.3V to 6V       |
| Input voltage        | -0.3V to VDD+0.3V |
| Junction Temperature | -40 to +150       |
| Storage Temperature  | -65 to +150       |

Note: Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device.

**Recommended Operating Conditions**

|                             | Min | Max | Unit |
|-----------------------------|-----|-----|------|
| Supply Voltage              | 2.8 | 5.5 | V    |
| Shutdown Voltage Input High | 1.3 | VDD | V    |
| Shutdown Voltage Input Low  | 0   | 0.4 | V    |

**Electrical Characteristics**

The following specifications apply for the circuit shown in Figure 5.

$T_A = 25$  , unless otherwise specified.

| Symbol       | Parameter                          | Conditions  | Spec               |                    |                    | Units      |
|--------------|------------------------------------|---|--------------------|--------------------|--------------------|------------|
|              |                                    |   | Min.               | Typ.               | Max.               |            |
| $I_{SD}$     | Shutdown Current                   | $V_{IN}=0V, V_{SDB}=0V, \text{No Load}$   |                    | 0.4                | 2                  | $\mu A$    |
| $I_Q$        | Quiescent Current                  | $V_{DD} = 2.8V, V_{IN} = 0V, \text{No Load}$  |                    | 2.2                |                    | mA         |
|              |                                    | $V_{DD} = 3.6V, V_{IN} = 0V, \text{No Load}$  |                    | 2.6                |                    |            |
|              |                                    | $V_{DD} = 5.5V, V_{IN} = 0V, \text{No Load}$  |                    | 4.0                | 8                  |            |
| $ V_{OS} $   | Output Offset Voltage              | $V_{IN} = 0V, A_v = 2V/V,$<br>$V_{DD} = 2.8V \text{ to } 5.5V$  |                    | 2                  | 25                 | mV         |
| PSRR         | Power Supply Rejection Ratio       | $V_{DD} = 2.8V \text{ to } 5.5V$  |                    | -75                |                    | dB         |
| CMRR         | Common Mode Rejection Ratio        | $V_{DD} = 2.8V \text{ to } 5.5V,$<br>$V_{IC} = V_{DD}/2 \text{ to } 0.5V,$<br>$V_{IC} = V_{DD}/2 \text{ to } V_{DD} - 0.8V$ |                    | -68                |                    | dB         |

**Test Circuit**

Figure 5. BL6311B test setup circuit

Figure 6. 30-kHz LPF for BL6311B test

- Notes:
- 1>.  $C_s$  should be placed as close as possible to VDD/GND pad of the device
  - 2>.  $C_i$  should be shorted for any Common-Mode input voltage measurement
  - 3>. A 33uH inductor should be used in series with  $R_L$  for efficiency measurement
  - 4>. The 30 kHz LPF (shown in figure 5) is required even if the analyzer has an internal LPF

**Component Recommended**

Due to the weak noise immunity of the single-ended input application, the differential input application should be used whenever possible. The typical component values are listed in the table:

| $R_I$ | $C_I$  | $C_S$  |
|-------|--------|--------|
| 150 k | 3.3 nF | 2.2 uF |

- (1)  $C_1$  should have a tolerance of  $\pm 10\%$  or better to reduce impedance mismatch.
- (2) Use 1% tolerance resistors or better to keep the performance optimized, and place the  $R_1$  close to the device to limit noise injection on the high-impedance nodes.

### Input Resistors ( $R_1$ ) & Capacitors ( $C_1$ )

The input resistors ( $R_1$ ) set the total voltage gain of the amplifier according to Eq1

$$Gain = \frac{2 \times 150k\Omega}{R_1} \left( \frac{V}{V} \right) \quad Eq1$$

The input resistor matching directly affects the CMRR, PSRR, and the second harmonic distortion cancellation.

If a differential signal source is used, and the signal is biased from  $0.5V \sim V_{DD}-0.8V$  (shown in Figure2), the input capacitor ( $C_1$ ) is not required.

If the input signal is not biased within the recommended common-mode input range in differential input application (shown in Figure3), or in a single-ended input application (shown in Figure4), the input coupling capacitors are required.

If the input coupling capacitors are used, the  $R_1$  and  $C_1$  form a high-pass filter (HPF). The corner frequency ( $f_c$ ) of the HPF can be calculated by Eq2

$$f_c = \frac{1}{2\pi \cdot R_1 \cdot C_1} \quad (Hz) \quad Eq2$$

### Decoupling Capacitor ( $C_S$ )

A good low equivalent-series-resistance (ESR) ceramic capacitor ( $C_S$ ), used as power supply decoupling capacitor ( $C_S$ ), is required for high power supply rejection (PSRR), high efficiency and low total harmonic distortion (THD). Typically  $C_S$  is  $2 \sim 2\mu F$ , placed as close as possible to the device VDD pin.

### Order Information

| Part Number | Package | Shipping               |
|-------------|---------|------------------------|
