

LM2937

LINEAR INTEGRATED CIRCUIT

500mA LOW DROPOUT VOLTAGE REGULATOR

■ DESCRIPTION

The UTC **LM2937** is a positive voltage regulator capable of supplying up to 500mA of load current. The use of a PNP power transistor provides a low dropout voltage characteristic. With a load current of 500mA the minimum input to output voltage differential required for the output to remain in regulation is typically 0.5V(1V guaranteed maximum over the full operating temperature range). Special circuitry has been incorporated to minimize the quiescent current to typically only 10mA with a full 500mA load current when the input to output voltage differential is greater than 3V.

The UTC **LM2937** requires an output bypass capacitor for stability. As with most low dropout regulators, the ESR of this capacitor remains a critical design parameter, but the LM2937 includes special compensation circuitry that relaxes ESR requirements. The UTC **LM2937** is stable for all ESR below 3Ω. This allows the use of low ESR chip capacitors.

Ideally suited for automotive applications, the UTC **LM2937** will protect itself and any load circuitry from reverse battery connections, two-battery jumps and up to +60V/-50V load dump transients. Familiar regulator features such as short circuit and thermal shutdown protection are also built in.

■ FEATURES

- * Fully specified for operation over -40°C~ +125°C
- * Output current in excess of 500mA
- * Output trimmed for 5% tolerance under all operating conditions
- * Typical dropout voltage of 0.5V at full rated load current
- * Wide output capacitor ESR range, up to 3Ω
- * Reverse battery protection
- * Internal short circuit and thermal overload protection
- * 60V input transient protection
- * Mirror image insertion protection
- * Built-in ON/OFF control function

■ ABSOLUTE MAXIMUM RATINGS (Note 1)

PARAMETER	SYMBOL	RATINGS	UNIT
Input Voltage	V_{IN}	26	V
Power Dissipation(Note 2)	P_D	Internally limited	
Maximum Junction Temperature	T_J	+150	°C
Storage Temperature	T_{STG}	-40 ~ +150	°C

Notes: 1. Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Electrical Specifications do not apply when operating the device outside of its rated Operating Conditions.

2. The maximum allowable power dissipation at any ambient temperature is $P_{MAX} = (125 - T_A) / \theta_{JA}$, where 125 is the maximum junction temperature for operation, T_A is the ambient temperature, and θ_{JA} is the junction to ambient thermal resistance. If this dissipation is exceeded, the die temperature will rise above 125°C and the electrical specifications do not apply. If the die temperature rises above 150°C, the LM2937 will go into thermal shutdown.

* Required if the regulator is located more than 3 inches from the power supply filter capacitors.

**Required for stability. C_{OUT} must be at least $10\mu\text{F}$ (over the full expected operating temperature range) and located as close as possible to the regulator. The equivalent series resistance, ESR, of this capacitor may be as high as 3Ω .
