

P1886

LINEAR INTEGRATED CIRCUIT

PWM CONTROL 3A STEP-DOWN CONVERTER

■ DESCRIPTION

UTC **P1886** consists of 3A step-down switching regulator control which includes a reference voltage source, oscillation circuit, error amplifier, internal PMOS and etc with PWM.

UTC **P1886** can provide low-ripple power, high efficiency, and excellent transient characteristics and an enable function, an over current protect function and a short circuit protect function are built inside, so the operation frequency will be reduced from 300KHz to 30KHz when OCP or SCP happens. And the PWM control circuit can vary the duty ratio linearly from 100 down to 0%. This converter also includes an error amplifier circuit as well as a soft-start circuit that prevents overshoot at startup. Also, to minimum external component count an internal compensation block is built in.

UTC **P1886** can work as step-down switching regulators with the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally. It provides such outstanding features: low current consumption. It is also suitable for the operation via an AC adapter because this converter can accommodate an input voltage up to 23V.

■ FEATURES

- * Soft-start, Current Limit, Enable function
- * Thermal Shutdown function
- * Built-in internal SW P-channel MOS
- * Input voltage: 4V to 23V.
- * Output voltage: 0.8V to V_{CC} .
- * Duty ratio: 0% to 100% PWM control
- * Oscillation frequency: 300KHz typ.

■ FUNCTION DESCRIPTION

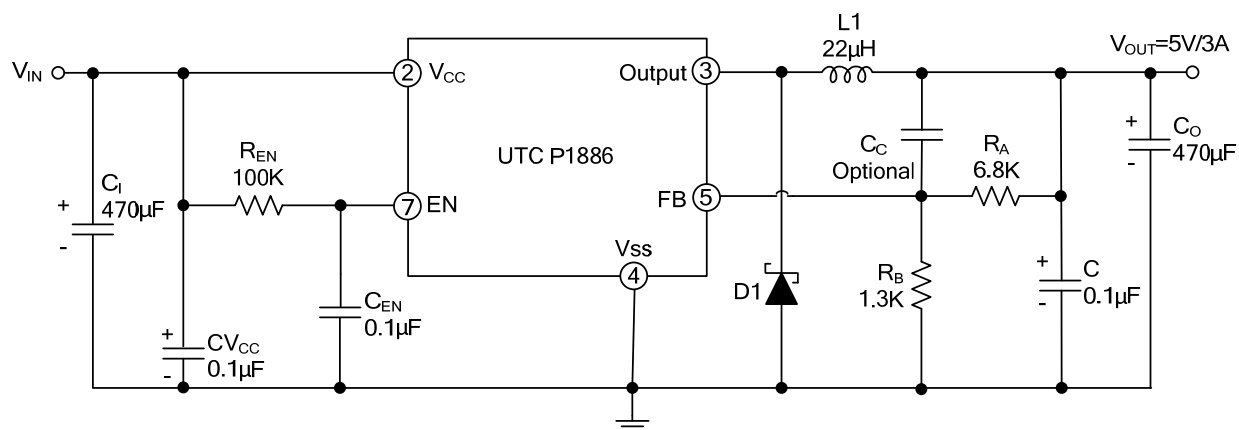

PWM Control

The UTC **P1886** consists of DC/DC converters which employ a PWM system. In this DC/DC converter, the pulse width varies in a range from 0 to 100% which is according to the load current. Cause the switching frequency remains constant the ripple voltage which produced by the switching can be removed easily through a filter. Therefore, these converters provide a low-ripple power over broad ranges of input voltage and load current.
