Preliminary

LINEAR INTEGRATED CIRCUIT

LOW POWER DUAL OPERATIONAL AMPLIFIERS

DESCRIPTION

The UTC **LMH358** is low noise, high voltage, and high slew rate operational amplifier. This circuit consists of two independent, high gain, internally frequency compensated operational amplifiers.

The input common mode range of the UTC **LMH358** can be beyond the rails. The UTC **LMH358** are with rail-to-rails output voltage swing. The quiescent current is 500µA per amplifier.

The UTC **LMH358** also feature fast slewing and settle-times, as well as high output drive capability of 60mA (source/sink).

These features make these amplifiers ideal for use as reference buffers for TFT-LCD. Other applications include battery power, portable devices, and anywhere low power consumption is important.
