CMOS IC

### LOW-VOLTAGE QUADRUPLE FET BUS SWITCH

#### ■ DESCRIPTION

The **U74CBTLV3126** quadruple FET bus switch features independent line switches. Each switch is disabled when the associated output-enable (OE) input is low.

The device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  feature ensures that damaging current will not backflow through the device when it is powered down. The device has isolation during power off.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

#### ■ FEATURES

- \* 5-Ω Switch Connection Between Two Ports
- \* Standard '126-Type Pinout
- \*  $I_{off}$  Supports Partial-Power-Down Mode Operation
